About the Course:

The digital signal processing (DSP) applications are in numerous infotainment, Medical diagnostics and advanced communication and radar systems. Always the advancements in VLSI technology will have an impact on the performance of these systems. VLSI DSP deals with such architectural and algorithmic optimization techniques to design high-performance DSP systems. As VLSI DSP needs inter-domain expertise of both DSP and VLSI domain, there is a huge necessity to impart the necessary concepts and handson skills to research scholars and faculty.

Course Objectives:

- Introduction to DSP VLSI
- Architectural transformation techniques (Retiming, Folding)
- Architectural transformation techniques (Unfolding)
- Numerical Strength reduction techniques
- Hands-on MATLAB for VLSI DSP
- Introduction to INTEL FPGA Design flow
- Introduction to DSP Builder
- Design flow using DSP Builder
- Industry practice and trends in DSP VLSI system Design flow

Expected Outcomes:

- At the end of Workshop, participants will be able to
- Simulate and verify a design.
 - Work with real time projects using Architectural transformation techniques (Retiming, Folding).
 - Work with real time projects using Architectural transformation techniques (Unfolding).
 - Work with real time projects using Numerical Strength reduction techniques.
 - Work with real time projects using DSP Builder.

About the Department:

Department of Electronics and Communication Engineering was started since the inception of Vignan's Institute of Management and Technology for Women during 2008 with an initial intake of 90. The strength was enhanced to 120 during 2010. The Department had added Post graduate programme in VLSI during the year 2011 and Embedded Systems during 2014 with an intake of 18 each.

The Department has state-of-art laboratories equipped with advanced and well maintained equipment, continuously updated application software packages, more than adequate computing systems with 24x7, 30 MBPS internet facility.

About the Course:

VLSI Stands for Very-large-scale integration (VLSI), which creates an integrated circuit (IC) by combining millions of MOS (Metal Oxide Silicon transistor) transistors over a single chip. The microprocessor and memory chips are VLSI (Very-large-scale integration) devices. Before the intro of VLSI technology, most ICs had a limited set of roles they could perform. IC (Integrated Circuits) are used in various types of electronic devices. Our mobile phone consists of IC. IC is a circuit where all or some of the circuit elements are inseparably linked and electrically interconnected, so it's considered indivisible for construction and commerce. Before VLSI, IC size used to be much larger than it is now. Because of VLSI, designers can now add millions of transistors and other components on a tiny chip.

Course Objectives:

- Overview of IC Design
- Aspects of IC Design
- Introduction and Device Characteristics
- Analog IC Design
- Digital IC Design
- Semicustom IC Design/PLD
- Introduction to cadence EDA
- Op Amp Design and Compensation
- VLSI Signal Processing
- VLSI Communication System Design

- Mixed Signal Design/RF IC Design
- FDGA/VHDL

Expected Outcomes:

At the end of Workshop, participants will be able to

- Model digital systems in VHDL and SystemC at different levels of abstraction.
- Partition a digital system into different subsystems.
- Simulate and verify a design.
- Transfer a design from a version possible to simulate to a version possible to synthesize.
- Use computer-aided design tools to synthesize, map, place, routing, and download the digital designs on the FPGA board.
- Apply knowledge of mathematics, science, and engineering to design and analysis of analog integrated circuits.
- Identify, formulate, and solves engineering problems in the area of analog integrated circuits.
- Use the techniques, skills, and modern programming tools such as Mentor Graphics, necessary for engineering practice.
